MANAGEMENT SYSTEM CERTIFICATE

Certificato n. / Certificate n.:

Data di emissione / Date of issue:

Validità / Validity:

Si certifica che il sistema di gestione di/This is to certify that the management system of

CONTROLCAVI INDUSTRIA S.r.l.- Sede Amministrativa ed Operativa

S.S. Casalina Km. 78,600 - 03013 Ferentino (FR) - Italy

È conforme ai requisiti della norma per il Sistema di Gestione Ambientale/
Has been found to conform to the Environmental Management System standard:

ISO 14001:2015

Valutato secondo le prescrizioni del Regolamento Tecnico RT-09/
Evaluated according to the requirements of Technical Regulations RT-09

Questa certificazione è valida
per il seguente campo applicativo:

Progettazione e produzione di conduttori e
cavi elettrici di bassa e media tensione,
attraverso le fasi di trafilatura, prefilatura,
isolamento, spiralatura, estruzione,
confezionamento e collaudo
(EA 19, 14)

This certificate is valid
for the following scope:

Design and manufacture of conductors and
electrical cables for low and medium
voltages, through the phases of drawing,
stranding, insulation, twisting, extrusion,
packing and testing
(EA 19, 14)

Luglio a Data/Date and date:
Vimercate (MB), 26 maggio 2018

Per l'Organismo di Certificazione:
For the Certification Body:
DNV GL - Business Assurance
Via Emanuele Park, 14 - 20871 Vimercate

Ships & offshore cables

BS 6883 - BS 7917

Halogen free Low smoke

Flame retardant

Fire resistant

FIREBAR® Fire & water resistant

Low temperature -40 °C

CCI ships and offshore cables according to BS 6883 and BS 7917

Are designed and manufactured to be installed in ships and oil & gas platforms where saline atmosphere, UV radiation, extremes of temperature, hydrocarbons, oils, drilling fluids and muds are the usual working conditions. Type approved by the most acknowledged Certification Bodies (refer to page 8), they present remarkable characteristics such as:

- **CONDUCTOR:** an unique flexible Class 2 conductor, originally patented by CCI and still utilised in all ships and offshore cables designs, allows for such ease of installation and thus reducing the time and cost, an ease of handling in the restrictions and confines of vessels and offshore platforms.
- The formation and manufacture process of our conductors, not only allows for the cables to safely be handled/installed at 4 times the Outer Diameter of the cable (normally allowed by Class 5 conductors), but with a cable affording superior handling characteristics (normally found with Class 5 conductors) we still maintain the Class 2 electrical characteristics, giving the added advantage over Class 5 conductors, which have higher resistance values and thus reduced ampacity.
- **INSULATION:** improved Ethylene Propylene Rubber (EPR) type GP4 and Hard grade Ethylene Propylene Rubber (HEPR) type GP6 for MV cables, are formulated and proven for conductor operating temperatures greater than 100 °C (refer to page 7)
- **FLAMEBAR®:** CCI has never compromised in choosing the components used to produce its cables, and Flamebar® tapes used in all constructions are testament of this. The high temperature resistance of these fibre glass tapes allows a very good heat barrier and further enhance non propagation of the flame of all our cables.
- **LOW OPERATING TEMPERATURE:** CCI's compounds, used in the production of ship and offshore cables, are formulated and proven, according to CSA standards, to operate down to - 40 °C.
- **SUNLIGHT, UV & OZONE RESISTANCE:** the whole range of sheathing compounds have been independently type tested to pass the most severe requirements of the standards for these critical factors when cables are installed externally on-board ships and offshore units.

on request

- **OUTER SHEATH SHF2 H-M oils & Muds resistant:** is compliant with SHF2, as stated in IEC 60092-360, together with the highest level of resistance when tested in Mineral, Hydraulic oils and Muds (type H-M) as defined in Table 1 Category d of NEK 606:2016 (refer to Generals section).

CCI cable Fire resistance

When fire breaks out in remote locations, such as oil/gas platforms or ships, the survival of all on board, and the containment of damage to equipment and structure, depends on the effectiveness of anti-fire devices, which are undoubtedly powered and controlled by electrical cables.

The cables installed in areas, with an assessed potential risk of fire, are always specified to be fire resistant.

At CCI, our manufacturing programme includes two cable constructions with substantial differences in their capabilities of maintaining circuit integrity, whilst sustain fire damage and the effects of extinguishing:

traditional

Until recently, standards have legislated for a resistance to fire and maintaining circuit integrity against the effects of fire ONLY.

Once these cable types are attempted to be extinguished with water (the usual method for fire extinguishing) the cables fail, as the protection of conductors relies solely upon a mica glass tape(s) which do not support water.

Mica glass tape, as a sole fire barrier, also has limitations in that it is only useful for voltages up to 1kV.

Fire tests are according to IEC 60331-1 or IEC 60331-2 applicable to the appropriate diameter of cable under test, with a requirement of Fire (at least 830°C) only and Mechanical shocks for a duration up to 2 hours.

FIREBAR®

The research and development to the 'age old' issue of installing a fire resistant cable that survives all aspects of fire and the extinguishing effects and is as easy to install as a conventional cable, has culminated in the CCI patented design of FIREBAR®.

The extensive proving and re-proving of the design allowed CCI to offer a guarantee for all TOTAL SAFETY on board, with unequalled performance.

FIREBAR® not only continues to operate in fire conditions, as you would expect, but, due to a unique design, fully functions whilst subject simultaneously attack of Fire, Mechanical shocks and a Water spray or Water jets combination.

What this means is that FIREBAR® provides, for an extended time to 2 hours, for safe evacuation of personnel and subsequent fire extinguishing.

FIREBAR® cables are already installed on platforms operated by BP, Total & Saipem, Shell & Technip, on SBM FPSOs and FNLGs and also where significant numbers of people would potentially be contained on Cruise ships operated by Carnival Group and built by Fincantieri.

FIREBAR® constructions, when manufactured to BS standards, cover the range from 150/250 Volt (Instrument types) up to 8,7/15 kV (Medium Voltage), and all in between.

The most stringent requirements set for cable testing have been in accordance to:

- BS7846:2000 Category F3 for Instrumentation and Low voltage power cables

- BS8491 for Medium voltage power cables

When submitted to the requirements of the a.m. standards, **FIREBAR®** cables, powered at nominal voltage rate, demonstrate their survival and continued operation against the combined effects of Fire (at least 830°C) + Mechanical Shocks + Water Spray or Water Jets, for a test timing of 2 hours, even when considering Medium Voltage cables.

Furthermore, beyond the requirements of any international fire resistance standard, **FIREBAR®** burned cables, after fully surviving 2 hours tests, as detailed above, are then immersed in water, still powered, to demonstrate the integrity of the construction (even after the effects of fire damage and extinguishing) and continued operation.

Insulating compound

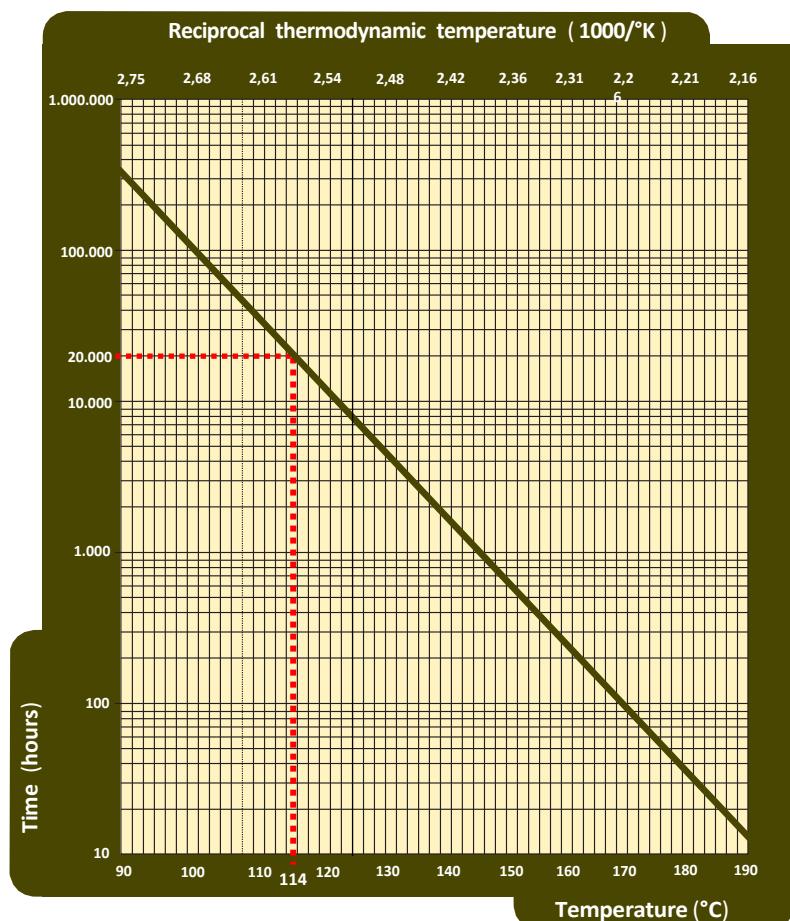

The maximum operating temperature allowed in an electrical cable depends on the insulating material.

CCI developed improved (H)EPR insulating compounds which offer superior insulation constant (K_i) and improved ageing performance at higher operating temperature than 90°C requested by IEC 60092-360.

The Arrhenius graph, hereunder reported, shows the Temperature Index T_i (*) achieved by performing a Thermal Endurance Evaluation (witnessed by DNV) on (H)EPR compounds in accordance to IEC 60216 standards.

$$T_i = 114 \text{ } ^\circ\text{C}$$

(*) The Temperature Index (T_i) is the the maximum continuous working temperature at which full insulation characteristics are still maintained.

PRELIMINARY

SHF2 H-M outer sheath (on request)

This code recognizes the highest level of Oils and MUDs (drilling fluids) resistance of elastomeric outer sheath referred to NEK 606:2016. The compound is based on SHF2 according to IEC 60092-360 and shall satisfies the requests in Table 1 Category d of the a.m. NEK, reported below:

| FLUID & TEST PARAMETERS | UNIT | REQUESTED |
|----------------------------------|------|-----------|
| • IRM 902 mineral oil | | |
| • IRM 903 mineral oil | | |
| • Hydraulic/gear oil | | |
| Temperature | °C | 100 ±2 |
| Duration | days | 7 |
| Tensile strength | % | ± 30 max |
| Elongation | % | |
| Volume | % | |
| Weight | % | |
| • CALCIUM BROMIDE drilling fluid | | |
| Temperature | °C | 70 ±2 |
| Duration | days | 56 |
| Tensile strength | % | ± 25 max |
| Elongation | % | |
| Volume | % | |
| Weight | % | |
| • EDC 95-11 drilling fluid | | |
| Temperature | °C | 70 ±2 |
| Duration | days | 56 |
| Tensile strength | % | ± 30 max |
| Elongation | % | |
| Volume | % | |
| Weight | % | |

NOTE : % = parameter variation from natural (before immersion)

ELECTRICALS

CONDUCTOR ELECTRICAL RESISTANCE

It's the most important parameter of the conductor sizing, related to:

| | |
|------------------------------|------------------------------------|
| ρ conductor resistivity | [$\Omega \text{ mm}^2/\text{m}$] |
| l conductor length | [km] |
| A cross sectional area | [mm^2] |

For low frequencies, conductor resistance is equal to DC condition.

$$R = \rho \times l / A \quad [\Omega]$$

For copper conductors:

$$\rho = 17,241 \times 10^{-6} \quad \Omega \times \text{mm}^2/\text{m} \text{ @ } 20^\circ\text{C} \text{ plain copper}$$

$$\rho = 17,931 \times 10^{-6} \quad \Omega \times \text{mm}^2/\text{m} \text{ @ } 20^\circ\text{C} \text{ tinned copper}$$

Temperature influence is calculated as:

$$R_t = R_{20} \times (234,5 + t) / 254,5 \quad [\Omega]$$

R_t conductor resistance [Ω]

R_{20} conductor resistance @ 20°C [Ω]

t conductor temperature [$^\circ\text{C}$]

Conductor resistance increases with frequency.

INSULATION RESISTANCE

It's the resistance to the flow of direct current between a conductor and the earthed core screen, armour and adjacent conductors.

A higher value of insulation resistance means better insulating capacity.

The measurement values, shall be corrected to the reference temperature of 20°C by mean a correction factor

$$R_t = K_i \times (\log_{10} D/d) \times L/1000 \times C_t \quad [\text{M}\Omega \times \text{km}]$$

R_t = measured insulation resistance referred to 1 km @ 20°C

K_i = insulation constant of insulation compound

for EPR (GP4) and HEPR (GP6) = 3670 [MΩ x km]

d = diameter over conductor [mm].

D = diameter over insulation [mm]

L = cable length [m]

C_t = temperature correction factor

Correction factor C_t

| 10°C | 11°C | 12°C | 13°C | 14°C | 15°C | 16°C | 17°C | 18°C | 19°C | 20°C |
|------|------|------|------|------|------|------|------|------|------|------|
| 0.50 | 0.54 | 0.57 | 0.2 | 0.66 | 0.71 | 0.76 | 0.81 | 0.87 | 0.93 | 1.00 |

| 20°C | 21°C | 22°C | 23°C | 24°C | 25°C | 26°C | 27°C | 28°C | 29°C | 30°C |
|------|------|------|------|------|------|------|------|------|------|------|
| 1.00 | 1.07 | 1.15 | 1.23 | 1.32 | 1.42 | 1.52 | 1.62 | 1.74 | 1.87 | 2.00 |

VOLTAGE RATING

The voltage designation of cables has three characteristic parameters:

- U_0 the rated power voltage between conductor and any earth or metallic screen.
- U the rated power frequency voltage between conductors
- U_m the maximum value of the highest system voltage which may be sustained under normal operating conditions at any time and at any point.

CURRENT RATING

Current carrying capacity, whatever is the type of covering (e.g. both unarmoured and armoured cables), depends from the cable installation method.

IEC 60092-352 standard reports the reference methods for which the current carrying capacity has been determined by test or calculation

The ELECTRICAL DATA reported in this catalogue are in accordance with:

- Table A.4 insulation rated temperature of 90°C
- Table A.5 insulation rated temperature of 95°C

They refer to:

- installation in free air @ 45°C
- continuous service @ max rated temperature
- single core cables with 3 of them in touch (method F)
- 2, 3 & 4 cores (method E)
- multicore cables (5 cores and over) subjected to correction factors
- current ratings, based on Class 2 conductors, refer to nominal dimensions of 0,6/1 kV cables.
- current rating for higher voltages 5 % lower than the tabulated values for LV cables

■ Continuous service

It's considered a duration longer than three times the Time Constant [T] of the cable (with constant load)

$$T = 0,245 d^{1,35}$$

d = cable overall diameter

[mm]

■ Correction factor for half-hour and one-hour service

When cables operate for intermittent periods of half an hour or one hour, the maximum current rating allowed can be increased multiplying the tabulated current rating by the following correction factor:

$$\sqrt{\frac{1,12}{1 - \exp(-t_s/T)}}$$

where:

$t_s = 30$ or 60 [min]

T = Time Constant of cable (see above Continuous Service)

■ Correction factor for intermittent service

For cables supplying a single motor or other equipment, operating in an intermittent service, the maximum current rating may be increased multiplying by a correction factor.

IEC 60092-352 standard reports a calculation example of such correction factor over a period of 10 min. with 4 min. at maximum current rating and 6 min unloaded

$$F_i = \sqrt{\frac{1 - \exp(-4/T)}{1 - \exp(-4/T)}}$$

Intermittence period = 10 [min]

Intermittence ratio (duty cycle) = 40 [%]

T = Time Constant of cable (see above Continuous Service)

■ Temperature correction factor

For different operating ambient temperature than 45°C and conductor at a max. rated temperature, the maximum permissible cable current rating has to be multiplied by the following correction factor:

| Max. rated conductor temp [°C] | Correction factors for ambient air temperature [°C] of | | | | | | | | | | |
|--------------------------------|--|------|------|------|------|------|------|------|------|------|------|
| | 35 | 40 | 45 | 50 | 55 | 60 | 65 | 70 | 75 | 80 | 85 |
| 90 | 1,10 | 1,05 | 1,00 | 0,94 | 0,88 | 0,82 | 0,74 | 0,67 | 0,58 | 0,47 | - |
| 95 | 1,10 | 1,05 | 1,00 | 0,95 | 0,89 | 0,84 | 0,77 | 0,71 | 0,63 | 0,55 | 0,45 |

SHORT CIRCUIT RATING

Short Circuit current is calculated as:

$$I_{sc} = k \times \frac{A}{\sqrt{t}} \quad [kA]$$

where:

| k factor | Insulation compound | Max. rated conductor temperature | |
|----------|---------------------|----------------------------------|------------------|
| | | Normal operation °C | Short-circuit °C |
| 1,43 | XLPE- EPR - HEPR | 90 | 250 |
| 1,71 | Silicone S95 | 95 | 350 |

A = conductor cross section [mm²]

t = short circuit duration [sec]

CURRENT to power and voltage

In case of three-phase systems, the determination of the current relationship between power and voltage is:

$$I = 722 \text{ kW/V} \quad I = 578 \text{ kVA/V} \quad I = 531 \text{ HP/V}$$

| | |
|------------------------------------|-------|
| I = current intensity | [A] |
| V = rated voltage | [V] |
| kW = power($\cos \varphi = 0.8$) | [kW] |
| kVA = power | [kVA] |
| HP = horse power | [HP] |

REACTANCE

When the cable operates in A.C., reactance is related mainly to axial distance between conductors.

For 2 - 3 - 4 conductors the Reactance per phase can be calculated as:

$$X = 2 \times \pi \times f \times L \times l \quad [\Omega]$$

| | |
|---------------|-------|
| f frequency | [Hz] |
| L Inductance | [H/m] |
| l core length | [m] |

INDUCTANCE

$$L = 0,2 \times (l_n 2a/d + 0.25) \times 10^{-6} \quad [\text{H/m}]$$

| | |
|--------------------------|------|
| a distance between cores | [mm] |
| d core diameter | [mm] |

IMPEDANCE

$$Z = \sqrt{(R^2 + X^2)} \quad [\Omega]$$

| | |
|--------------------------------|----------|
| Z Impedance per phase | [\Omega] |
| R Electrical resistance @ 20°C | [\Omega] |
| X Reactance per phase | [\Omega] |

CAPACITANCE

■ Single core cable

$$C = \epsilon_r / 18 \log_e (D/d) \quad [\mu\text{F}/\text{km}]$$

| | |
|--|-----|
| ϵ_r relative permittivity of insulation | |
| D diameter over insulation | [m] |
| d diameter over conductor | [m] |

■ Multicore belted cable

In the above equation:

D = diameter of one conductor + insulation between conductors + thickness of belt between any core and the metal screen or armour

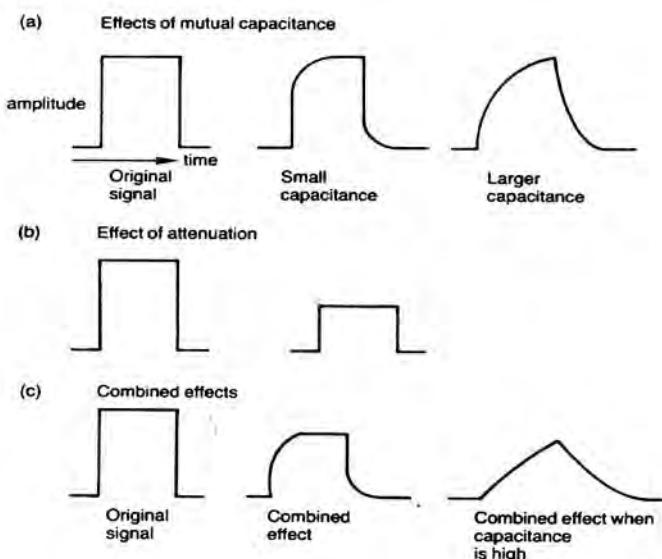

■ Digital signals

Small and larger capacitance causes distortion of digital signals

It depends by:

- conductor construction (increasing of conductor size means larger capacitance)
- insulation thickness (inversely proportional)
- insulation permittivity

In high frequency transmission capacitance rounds or distorts the pulse shape as shown hereafter:

VOLTAGE DROP (up to 1 kV)

$$\Delta V = K \times I \times L / 1000 \quad [V]$$

I rated current [A]

L cable length [km]

K correction factor (see table)

| conductor section [mm ²] | K (correction factor) | | | | | |
|---|-----------------------|------------|----------|------------|----------------------|------------|
| | 2 cores | | 3 cores | | 3 cores (three foil) | |
| | cosφ = 1 | cosφ = 0,8 | cosφ = 1 | cosφ = 0,8 | cosφ = 1 | cosφ = 0,8 |
| 1 | 45,0 | 36,1 | 39,0 | 31,3 | 38,3 | 30,8 |

VFD - EMC characteristics

Variable Frequency Drive (VFD) devices control AC motors speed and torque by varying their input frequency and voltage.

EMC (Electro Magnetic Compatibility) is the ability of the equipment components to minimize the electrical interferences (radio frequency disturbance and electrical surges) produced by such a device.

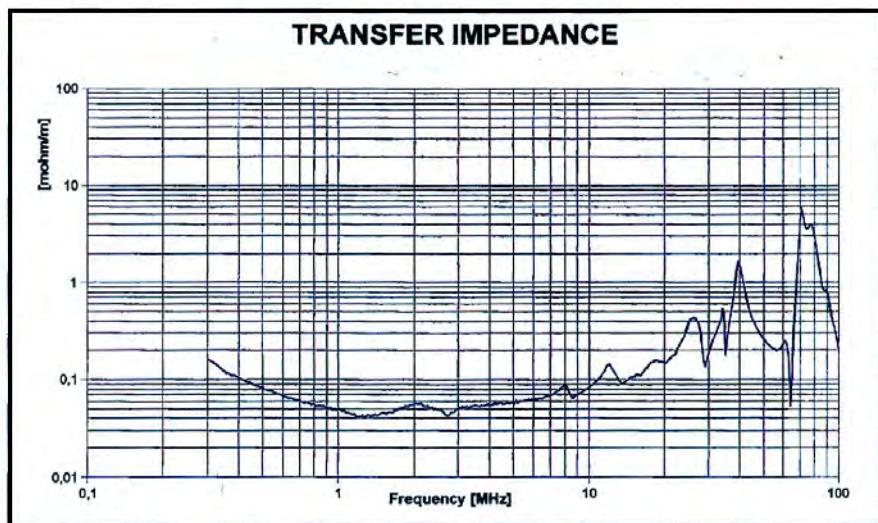

To face electrical surges safely, a working voltage rate of 0,6/1 kV implies to adopt 1,8/3 kV (3,6 kV peak) cable construction.

Furthermore, to minimize EM interferences, cables shall be copper tape shielded as protective hearting.

The parameter of surface Transfer Impedance describes the shielding effectiveness.

Its value shall be lower than 100 mΩ/m in the frequency range up to 100 MHz.

The diagram shows the typical Transfer Impedance (< 6 mΩ/m) measured on CCI VFD EMC cables.

Fixed installations in hazardous area

The cables mentioned in this catalogue are appropriate to operate in hazardous area. Their construction includes:

- circular and compacted conductor
- extruded bedding and sheaths
- non-hygroscopic fillers, when adopted

and prevents gas or vapour migration in accordance to the requirements of IEC 60079-14 Annex E

MECHANICALS

PULLING TENSION DURING INSTALLATION

- unarmoured cables

$$P = 25 \times S_c \quad [N]$$

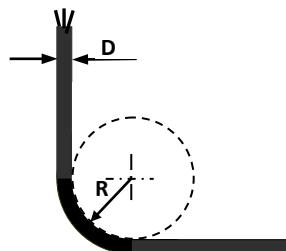

- armoured cables

$$P = 50 \times S_c \quad [N]$$

$$S_c = \text{total cross section of pulled conductors} \quad [\text{mm}^2]$$

BENDING RADIUS

The recommended minimum internal Bending Radius of cables in this catalogue is related to the their outer diameter (D).

D = cable outer diameter [mm]
 R = Bending Radius [mm]

Good practice is to reach progressively the minimum bending radius, with suitable round tools to help the correct bending, in particular when cable installation is performed at low temperature.

- Minimum installation temperature - 20°C
- Minimum operating temperature - 40°C

CONVERSION TABLE U.S. to METRIC cross sections

| AWG (U.S.) | Metric cross-section [mm ²] | Standard metric cross-section [mm ²] |

BS 6883-7917 SHIPS & OFFSHORE CABLES CATALOGUE 2021

All data mentioned in this catalog may be subject to continuous revision and improved at any time
